

Lab 06 - Create a Restaurant Class

200pts pts total.

Problem

This is taken from chapter 9-1 in the textbook.

Make a class called `Restaurant`. The `__init__()` method for `Restaurant` should store two attributes: a `restaurant_name` and a `cuisine_type`. Make a method called `describe_restaurant()` that prints these two pieces of information, and a method called `open_restaurant()` that prints a message indicating that the restaurant is open.

Make two instances of the restaurant using your class. One with a restaurant called 'Good Eats', and the other with a restaurant called 'Family Diner'.

Implement an automated test that checks that `open_restaurant()` works correctly.
